Large Deep Wound

Patient: Splash – Paint Horse – 1 y.o.

Splash was brutally attacked by another horse. The wounds on both sides of the neck were so deep, with such massive loss of cutaneous tissues that the first veterinary surgeon thought the horse had to be euthanized.

The owner asked for a second opinion. Another veterinary surgeon recommended Derma Gel[®] as the only possibility to save the horse.

Derma Gel[®] Treatment

After 6 weeks, the wound healed very fast without suturing, without bandaging while the horse was left in the field.

Key Points:

- Fast healing (60% faster than any other product)
- No proud flesh or hair discoloration on regrowth
- Protective film effect + insect repellent
- GeL stayed where applied (vertically)
- No infection
- No suturing
- No bandaging
- No loss of mobility (no tissue adherence)
- Best value for money (fast healing = less applications)
